

THE BULLYING PERCEPTION GAP

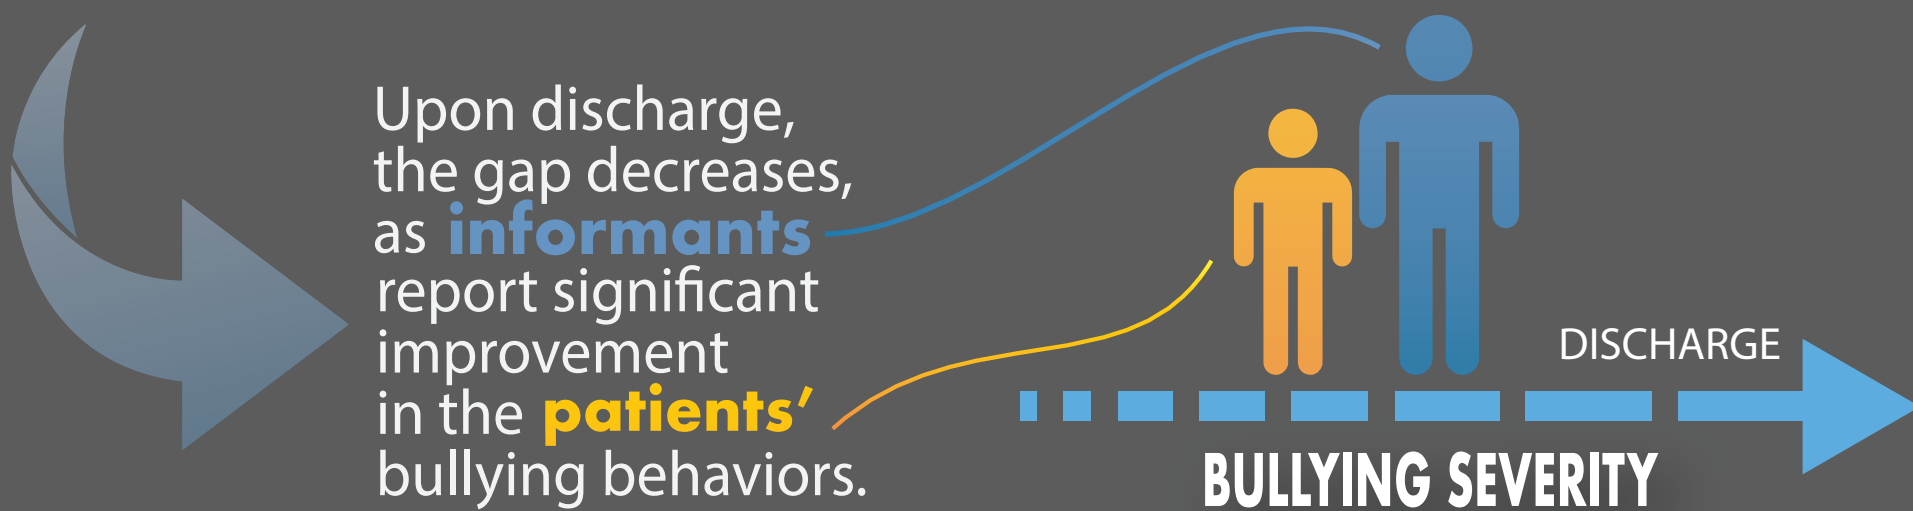

1 in 3 child/adolescent patients report committing bullying behaviors at admission

At admission, **patients** rate their own bullying behaviors as less severe than **informants** do.

Upon discharge, the gap decreases, as **informants** report significant improvement in the **patients'** bullying behaviors.

KEY TAKEAWAYS

- Child and adolescent patients may not fully recognize the impact or severity of their behaviors.
- Collect CABA assessments from patients and informants to maximize insight into bullying (and other behaviors).
